(a)

(b)

Mapping to a quantum circuit

(c)

Adjacent Clifford gates in the compiled circuit are grouped into Clifford layers, each indicated by a blue box

Compilation to the native gate set (rotation angle of R_Z gate omitted)

(d)

Modeling of noise

(e)

Construct a Clifford circuit set $\{\mathscr{C}(\phi^{(m)})\}_m$ where only the rotation angle of R_Z gates is different from the target noiseless circuit (R_Z gate is represented by its rotation angle)

(f)
